

CASE STUDY | Sustainable Workspace

The upper cabinet is created with a writable surface material. What a fun way to jot down notes and personalize your space!

The final product.

Sustainable Workstation Solution

designed by Lauren Murphy

SITUATION

A major international architect and design firm was looking for a sustainable work environment for their offices. They wanted to use products that had custom dimensions and finishes. They specifically had a brown Microdot laminate in mind for lower casegoods units and a glossy white on the upper cabinet to use as a marker board. The firm was considering using Herman Miller for the project, but were apprehensive because they could not meet their custom requirements.

SOLUTION

The Studio design team from Vanerum pulled together a custom solution for the client using the design of the Content Furniture line as the foundation. The furniture uses sustainable Skyblend cores that contained water-based glues with ABS worksurface edges to lower the formaldehyde emissions. The laminates for both surfaces and storage units were all Greenguard Certified.

RESULT

The client couldn't be happier with the way everything turned out. The product looks like they were always part of the stations and comments from the employees have been very positive.
