

This school in California has been providing quality educational programs that prepare students for the challenges of a modern workforce since 1921. The school focuses on career and technical training and strives to **"inspire success.... one student at a time."**

Integrating technology into classrooms is always a major challenge, this college needed a mobile solution that offered lockable storage, wire management and an internal layout that fit the exact technology components selected by the school.

The Vanerum•Stelter Studio design team worked with the IT specialists at the school as well as the architect to create a mobile tech cart that met their exact needs and matched the design aesthetic of the space.

This tech cart features a unique electronic monitor lift system provided easy access to technology. With the touch of a button the monitor can be raised out of, or lowered into the cart providing added security and increased workspace when the monitor is not in use.

The internal layout of the cart was designed to integrate both the specific CPU and an extensive wire management system. The durable locking casters works well on both hard and soft surfaces for increased mobility while the perforated metal inlay reflects the modern aesthetic of the campus and helps to regulate the internal temperature of the cart.
